Hla Ahmed

Deliverable #2

Part1: User stories:

1. **External stakeholders:**

    - **Dr Omar Rizk:**

    "As a **lead verifier**, I want to check the inspection results and evidence, so that all the information is accurate."

    Acceptance criteria:

    Given that the inspection results and evidence are available, when the lead verifier checks on them and confirms that the farm passed the inspection, then the system should save the farm's result as passed.

INVEST evaluation:

INVEST	**Ratings**	**Improvements**
Independent	Partially	No change needed.
Negotiable	Yes	No change needed.
Valuable	Yes	No change needed.
Estimable	Partially	Specify the inspection results, photos, and location details.
Small	Yes	No change needed.
Testable	Partially	Add a test to make sure the evidence can be checked.

2. **Operational Stakeholders:**

    Mahmoud Eid: "As a **field agents' supervisor**, I want to track the farmer registrations, so that I can make sure the agents complete their registering on time."

Acceptance Criteria:

Given that field agents have registered farmers in the system, when the supervisor checks the registration progress, then the system should display the total number of registered farmers and their registration status.

INVEST evaluation:

INVEST	**Ratings**	**Improvements**
Independent	Yes	No change needed.
Negotiable	Yes	No change needed.
Valuable	Yes	No change needed.
Estimable	Partially	Explain whether progress includes completed and pending problems.
Small	Yes	No change needed.
Testable	Partially	Add acceptance criteria to check registrations are completed on time

- **Eng. Hamdy Saber:**

"As a **land officer**, I want to check if plot boundaries overlap, so that I can solve land issues and make sure each plot is registered correctly."

Acceptance Criteria:

Given that the plot boundaries are saved in the system, when the land officer checks the boundaries and finds no overlapping farms, then the system should confirm that there are no overlaps and allow the registration to continue.

INVEST evaluation:

INVEST	**Ratings**	**Improvements**
Independent	Yes	No change needed.
Negotiable	Yes	No change needed.
Valuable	Yes	No change needed.
Estimable	Yes	No change needed.
Small	Partially	Keep the story focused on checking overlapping plots and creating a separate story for solving land disputes.
Testable	Partially	Add another acceptance criteria explaining what happens when overlapping plots are found

Part 2: Use Case Identification – Event decomposition technique:

I. Temporal events identification:

Temporal Event Description	Time	use case
The scheduled import satellite results are due	**Every 10 days**	Import satellite results
The scheduled carbon auction is due	**At the end of every season**	Conduct credit auction
The seasonal farmers' earning report is due	**Every season**	Generate seasonal earning report

Perfect technology assumptions:

Temporal Events	Use Cases	Perfect Technology Assumptions
The system imports satellite results every 10 days	Import satellite results	**Keep, a its Business monitoring activity**
Carbon Credit auction takes place every 3 months	Conduct credit auction	**Keep, Business activity**
The system prepares farmers' earnings reports every season	Generate seasonal earnings report	**Keep, Business activity**

II. Brief use case description:

- **Temporal events:**

Use case id	Use case name	Brief use case description	Actor(s)	Triggering event

E08	Import satellite results	The system imports results from satellites every 10 days and saves the information	**External satellite data provider**	The scheduled import satellite results are due
E09	Conduct Credit Auction	The system lets companies place bids for carbon credits and saves the auction results	**Companies/ Buyers**	Carbon Credit auction takes place every
E10	Generate seasonal earning reports	The system prepares a report showing how much money a farmer gets	**Non-Scheduled event**	The seasonal farmers' earning report is due
